

Why do prop brands not always recommend the same propeller?

The short version is the blade area of the propeller. The size of the diameter and the pitch of the propeller is key to determine the optimal size of the propeller. So, how much the blade area covers, and the width of the individual blades has an impact on the recommendation. These key points are very different when looking at different prop brands. Just have a look at the pictogram below.

Propeller Blade Areas Compared - All 19-in. Diameter

When requesting a free quote from us, we ask you about your sailing style and preferences. When making propeller recommendations, it's important for us to know whether you're a racer or leisure sailor, as the type of propeller you need varies accordingly.

For instance, both a 2-blade and 3-blade propeller might be suitable, depending on your specific sailing style.

That's why we never offer just a standard recommendation. We take both technical specifications and personal preferences into account.
